

Insertion of Background in CSS

In CSS, the background property is used to set the background of an HTML element. The background property can be used to set the background color, background image, and other background properties of an element.

To set the background color of an element, you can use the "background-color" property and set it to a color value (e.g. "background-color: red;").

To set a background image, you can use the "background-image" property and set it to the URL of the image file (e.g. "background-image: url('image.jpg');").

Example:

```
div {  
  background-image: url("image.jpg");  
}
```

Styling the background image

There are several ways to style the background image in CSS, some of which include:

Using the background-size property: We can use this property to set the size of the background image. The value can be set in pixels, percentages, or using keywords like "cover" and "contain". For example, "background-size: cover;" will make the background image cover the entire element, while "background-size: 50%;" will set the background image to be half the size of the element.

Using the background-position property: This property can be used to position the background image. The value can be set in pixels, percentages, or using keywords like "top", "bottom", "left", and "right". For example, "background-position: center;" will center the background image, while "background-position: bottom right;" will position the background image to the bottom right corner of the element.

Using the background-repeat property: This property can be used to control how the background image repeats. The value can be set to "repeat-x", "repeat-y", "no-repeat" or "repeat".

Here is an example code:

```
div {  
  background-image: url("image.jpg");  
  background-size: cover;  
  background-position: center;  
  background-repeat: no-repeat;  
}
```
