HTML5 Attributes

HTML5 is the latest version of HTML, and it introduces a number of new attributes that can be used to improve the functionality and accessibility of web pages. Here are a few examples of commonly used HTML5 attributes:

autofocus: When used on an <input> or <textarea> element, the autofocus attribute causes the element to automatically receive focus when the page loads, allowing users to begin typing or interacting with the element immediately.

required: When used on an <input> element, the required attribute specifies that the input field must be filled out before the form can be submitted.

min, max: When used on an <input> element, these attributes specify the minimum and maximum value that the input can have.

formnovalidate: When used on an <input> element that is a submit button, this attribute tells the browser that the form should not be validated when the user clicks the button.
